A grass-like plant with narrow upright spiky foliage to about a foot tall. Related to philodendrons. Can be grow in shade or filtered sun. Slowly spreads as a ground cover. Divides easily. Can be used for a bog plant. This selection has a white variegation that shows up beautifully in dark spots.			
<u>Aspidistra 'Ginga'</u>	Cast Iron Plant	Origin Japan	Family Liliaceae
An evergreen ground cover that runs by underground rhizomes. The common name cast iron plant come from the easy of growth under low light conditions and it's ability to tolerate neglect. The wide bladed sword-like leaves provide great texture. Can also be grown as a houseplant. This selection grows to 1' tall and has random spotting of the foliage. They are somewhat slow.			
<u>Campanula poscharskyana 'Pink'</u>	Bellflower	Origin Mediterranean (Croasia -	Family Campanulacaeae
Easy to grow Mediterranean ground cover in partial shade with regular water. Can take more sun at the coast. From the mountainous regions near the Adriatic sea. Not all Campanulas do well in San Diego, this one thrives. Easy to propagate by division. Normally blue star-like flowers in the spring time, this form is light pink.			
<u>Heuchera maxima</u>	Native Coral Bells	Origin California - Coastal Islands	Family Saxifragaceae
Our native coral bell, from the islands off the coast of Southern California. Unlike the more common hybrids from Eastern and Central America, many developed in England, this species and it's hybrids develop a large tap root, which makes them more tolerant of dry conditions. This clumping perennial has scalloped foliage to 2' with narrow flower spikes in the spring and summer up to 3'. The small tubular flowers are cream flushed pink. Best in the shade, with regular water to establish.
